

RUST-RAIDER™
PREPARES RUSTED METAL,
NEW METAL, ALUMINUM &
GALVANIZED METAL
FOR PAINTING

Rust Raider™ is a special blend of Phosphoric Acid, Sodium Bichromate and Surfactants formulated to react with iron oxide (rust) to chemically convert it to iron phosphate, forming a phosphate polymer corrosion resistant coating. It is also used to etch new ferrous metal surfaces, aluminum and galvanized steel prior to painting and is used as an adhesion promoter in adhesive bonding applications. Many leading paint manufacturers recommend using this type of product as a pretreatment coating to be used before priming and top coating.

Available Sizes

- 1840** - 32 fl oz. spray bottle w/ spray applicator 6/case
- 1840NS** - 32 fl oz. bottle NO spray applicator 6/case
- 1841** - 1 US gallon bottle NO spray applicator 4/case
- 1841-50** - 1 US gallon bottle

Neutralizes Rust
Converts Rust To A Phosphate Polymer Coating
Etches Steel, Galvanized Steel & Aluminum
Improves Adhesion Of Primers

Stops Further Corrosion
Professional Strength
Extends Life Of Coatings
Fast Acting
Easy To Apply

NOTE: Removing and converting bleeding rust from painted surfaces can be accomplished, however, paint qualities vary greatly and dulling and/or peeling may occur. Always test RUST-RAIDER on a small area first. International Epoxies & Sealers assumes no liability for damages to finished surfaces.
